

AUSTRALIAN STANDARD GEOGRAPHICAL CLASSIFICATION (ASGC) MANUAL

FOR USE IN STATISTICAL WORK

R. J. CAMERON
Australian Statistician

Australian Bureau of Statistics Canberra, Australia

Catalogue No. 1216.0

**AUSTRALIAN STANDARD GEOGRAPHIC
CLASSIFICATION (ASGC)**

SUPPLY OF REPLACEMENT PAGES

The ASGC provides a single Australia-wide ABS area classification and coding scheme for use in classifying statistics by geographical areas. It replaces the various Australia-wide area classification schemes now in use by the ABS.

The classification will be updated regularly by means of replacement pages.

Please complete the order form below and return to ABS to ensure regular receipt of replacement pages.

Order form despatched to ABS...../...../.....

PREFACE

The Australian Standard Geographical Classification (ASGC) has been prepared by the Australian Bureau of Statistics (ABS) for use in the collection, compilation and publication of its statistics. The ABS encourages other organisations to use this Classification in their own statistical work in order to improve the comparability and usefulness of statistics generally.

In preparing this classification the ABS has carried out an extensive review of existing spatial unit schemes involving a substantial program of investigation and analytical work. As a result the ASGC provides a single Australia-wide ABS area classification and coding scheme in place of the various equivalent existing Australia-wide schemes. All the usual spatial units contained in these schemes have been retained whilst the differences in spatial units between the schemes have been removed. In addition a standard set of codes for all the spatial units contained in the ASGC has been introduced.

A summary description of the Classification is provided in Chapter 1. A fuller understanding of the classification may be gained by reading the more detailed explanatory material in Chapters 2 to 5.

The ASGC is being maintained up to date on a continuous basis by the issue of replacement pages. Any inquiries about the Classification or suggestions for revisions should be directed to the Classification Section of the ABS in Canberra.

May 1985

ABBREVIATIONS

The following abbreviations are used in this manual:

. Spatial Unit Type

CD	- Census Collection District
Legal LGA	- Legal Local Government Area
S/T	- State or Territory
SD	- Statistical Division
S Dist.	- Statistical District
SLA	- Statistical Local Area
SRA	- Statistical Retail Area
SSD	- Statistical Subdivision
UC/L	- Urban Centre/(Rural) Locality

. Legal LGA Type

(B)	- Borough
(C)	- City
(DC)	- District Council
(M)	- Municipality
(S)	- Shire
(RC)	- Rural City
(T)	- Town

. States/Territories

NSW	- New South Wales
VIC	- Victoria
QLD	- Queensland
SA	- South Australia
WA	- Western Australia
TAS	- Tasmania
NT	- Northern Territory
ACT	- Australian Capital Territory

CHAPTER 1: SUMMARY DESCRIPTION OF THE CLASSIFICATION

INTRODUCTION

1. This chapter provides a brief outline of the ASGC and is based on the material presented in Chapters 2-5 of this manual. It is recommended that these be referred to for a more comprehensive description of the classification.

THE NATURE AND SPATIAL UNITS OF THE ASGC

2. The ASGC is a system for the classification of statistical units by geographical areas.

3. Common types of statistical units so classified are households in population censuses and surveys and establishments (eg individual farms, mines, factories and shops) in economic censuses and surveys. Once these units have been classified (ie assigned ASGC codes) statistics collected about them can be compiled and published (subject to normal confidentiality restraints) for ASGC geographical areas.

4. The geographical areas, or 'spatial units', incorporated in the ASGC cover the following:

- . CENSUS COLLECTION DISTRICTS (CD's). These are the smallest type of spatial unit in the ASGC and the smallest area building blocks of which all other ASGC spatial units are composed. They have been designed for use in population censuses and, in aggregate, cover the whole of Australia without omission or duplication. At the time of the last, ie 1981, Census of Population and Housing Australia was divided into 26,759 CD's.

- . STATISTICAL LOCAL AREAS (SLA's). These consist of one or more CD's and are local government area (ie Legal LGA) based or equivalent spatial units. They cover, in aggregate, the whole of Australia without gaps or overlaps and are used, in general, as the smallest type of spatial unit for the geographic classification of establishment locations and for the compilation and publication of economic, social and demographic statistics other than those collected in population censuses. (Statistics collected in population censuses are produced for CD's as well as SLA's and other ASGC spatial units.)

- . STATISTICAL SUBDIVISIONS (SSD's). These consist of one or more SLA's and cover, in aggregate, the whole of Australia without gaps or overlaps. They are used as an intermediate level, general purpose regional type spatial unit.

- . STATISTICAL DIVISIONS (SD's). These consist of one or more SSD's and cover, in aggregate, the whole of Australia without gaps or overlaps. They are used as a large, general purpose regional type spatial unit.

. STATES AND TERRITORIES (S/T's). These consist of two or more SD's and cover the whole of Australia (as defined for statistical purposes) without gaps or overlaps. They encompass the geographic areas of the six Australian States and two mainland Territories.

. STATISTICAL DISTRICTS (S DIST's). These consist of one or more SSD's and represent the more important, predominantly urban areas of Australia outside State capital city SD's. Because of their nature they can and, in some cases, do straddle SD and S/T boundaries. An example is the 'Gold Coast-Tweed' Statistical District which encompasses an urban area which lies partly in the State of Queensland and partly in the State of New South Wales.

. LEGAL LOCAL GOVERNMENT AREAS (LEGAL LGA's). These consist of one or more SLA's and are the geographical areas of incorporated local government councils, such as towns and shires. In aggregate, these cover only part of Australia. (The major areas of Australia not governed by incorporated local government councils include the northern parts of South Australia, most of the Northern Territory and all of the Australian Capital Territory.) Legal LGA's can and, sometimes, do straddle SSD, S Dist. and SD boundaries. An example is Tweed Shire in New South Wales. The predominantly urban part of this Shire is treated as an SLA as well as an SSD in its own right and constitutes the New South Wales part of the 'Gold Coast-Tweed' Statistical District. The predominantly rural remainder of this Shire constitutes a separate SLA outside the 'Gold Coast-Tweed' Statistical District and lies within a different SSD.

. STATISTICAL RETAIL AREAS (SRA's). These consist of one or more SLA's within SSD's and cover the whole of Australia without gaps or overlaps. They are used as the smallest type of spatial unit for the publication of retail and certain services industry statistics.

. URBAN CENTRES AND (RURAL) LOCALITIES (UC/L's). These consist of one or more adjoining CD's with urban characteristics and represent, in the case of rural localities, population clusters of between 200 and 999 people and, in the case of urban centres, population clusters of 1000 or more people (including known holiday resorts of smaller size). Because of their nature they can and, sometimes, do straddle SLA, Legal LGA, SSD and other ASGC spatial unit boundaries.

. SECTIONS OF STATE. These are non-contiguous areas with particular urban or rural characteristics. The following four Sections of State are distinguished within each State and Territory: major urban, other urban, locality and rural balance - the latter two constitute the rural part of each State/Territory.

5. Chapter 3 provides a more comprehensive treatment of ASGC spatial units and specifies the principles and criteria according to which they are delimited. Chapter 6 and the Appendixes list all ASGC spatial units within the context of the various ASGC structures but omit CD's, at present.

THE STRUCTURE OF THE ASGC

6 The ASGC spatial unit descriptions in the preceding paragraphs already indicate the structure of the ASGC by specifying how ASGC spatial units relate to each other in a hierarchically structured way. They indicate, for example, that CD's, the smallest spatial units and area building blocks in the ASGC, form the lowest or most detailed hierarchic level of the classification and add, without gaps or overlaps, to SLA's which, in turn, represent another, higher hierarchic level and add, without gaps or overlaps, to SSD's, etc. Such a chain of linked ASGC hierarchic levels (ie one in which the spatial units in adjoining levels relate to each other by aggregation in an upwards direction and disaggregation in a downwards direction) constitutes an ASGC structure. However, since some ASGC spatial unit types do not relate to each other in this way (because they cut across each other, as is the case with some Legal LGA's and SSD's), it is not possible to fit all ASGC spatial unit types into a single structure. Instead, several structures are needed, all of which can be derived from the one set of CD's at the lowest hierarchic level of the classification.

7 Accordingly, the ASGC has been constructed as an integrated multi-structured hierarchic classification in which CD's are aggregated upwards in several parallel streams (or chains) into progressively larger spatial units at progressively higher hierarchic levels of the ASGC. The ASGC structures, the hierarchic levels (or spatial unit types) of which they are composed and the total area covered by them are shown in the table below.

ASGC STRUCTURE	HIERARCHIC LEVELS		TOTAL AREA
Main	5	CD's, SLA's, SSD's, SD's, S/T's	Australia
S Dist.	4	CD's, SLA's, SSD's, S Dist's	Part of Aust.
Legal LGA	4	CD's, SLA's, Legal LGA's, S/T's (a)	Part of Aust.
SRA	6	CD's, SLA's, SRA's, SSD's, SD's, S/T's	Australia
UC/L	2	CD's, UC/L's	Part of Aust.
Sect. of State	3	CD's, Sections of State, S/T's	Australia

(a) Incorporated areas only.

8 The ASGC structural chart on page 8 of Chapter 2 depicts the ASGC structures in diagrammatic form as one integrated framework and shows the relationships between the structures. Chapter 2 also describes each of the structures in detail and specifies the principles according to which the ASGC has been constructed. Chapter 6 and the Appendixes depict the structures in their full detail.

THE ASGC IN ABS STATISTICAL GEOGRAPHY

9 Although the ASGC is the principal Australia-wide geographical classification of the ABS it cannot, for technical and other reasons, incorporate all spatial unit types for which the ABS produces statistics in response to user needs, such as Postcode Areas and Electoral Divisions. These, together with the ASGC, will be described in a wider and more comprehensive document, currently under preparation, entitled the 'Geographic Classification Framework' (GCF).

THE SPATIAL UNIT CODE SYSTEM

10 Each ASGC spatial unit in the classification is designated by a numeric code which identifies it. The system of codes is described in Chapter 4 and the code of each spatial unit is specified in the ASGC structures which are fully set out in Chapter 6 and the Appendixes.

MAINTENANCE OF THE CLASSIFICATION AND ITS USE IN PUBLICATION

11 The ASGC is being kept up to date on a continuous basis by the issue of replacement pages.

12 Maintenance of the ASGC manual (which presents the classification primarily in a conceptual sense and as a statistical standard) and of ASGC based/related material (used in applying the ASGC in statistical work such as ASGC descriptor sets, area coding reference data sets and maps) is shared by a number of organisational entities within ABS State and Central Offices and is coordinated by Classification Section, which is also responsible for maintaining the ASGC manual itself.

13 As far as publication of statistics according to the ASGC is concerned, it is recommended that a number of rules be followed to ensure that ASGC classified statistics are presented consistently and in a manner which optimises comparability between different statistical series/collections. These rules are specified in Chapter 5 which also provides more detail on the nature of ASGC maintenance.

ORDER OF STATES/TERRITORIES

14 One aspect of the ASGC is the ordering of States and Territories in data processing and in published statistical tables, data tapes and other forms of dissemination. This is a matter of some importance, firstly because it involves standards for the consistent presentation of statistics (through time, as well as between various publications); secondly, because it has ramifications throughout many aspects of data processing, ranging from the insertion of location codes on unit records in a large number of statistical collections, to the identification of aggregated data at the State level. It has implications for producers and users of data everywhere, and has special importance where current and historical data files are used together in computer processing systems. Comparative analysis of data provided in computer readable form from successive population censuses is a case in point. Consistency in this aspect of area classification is therefore seen as of fundamental importance if errors in handling data, and costly conversions of data codes, are to be minimised.

15 The order that has been adopted in the ASGC is one which has been widely used as a standard for very many years not only in the ABS but in other organisations that have been guided by ABS practice. That order is as follows:

<u>State</u>	<u>Code</u>	<u>State</u>	<u>Code</u>
NSW	1	WA	5
VIC	2	TAS	6
QLD	3	NT	7
SA	4	ACT	8

The ABS will continue this order in the presentation of statistics in printed tables, data tapes, microfiche, etc, and accordingly has retained this standard in the ASGC.

CHAPTER 2 : NATURE, STRUCTURE, PURPOSES AND PRINCIPLES OF THE CLASSIFICATION

NATURE AND STRUCTURE OF THE CLASSIFICATION

1 The Australian Standard Geographical Classification (ASGC) is a system for the classification of statistical units, such as households and establishments by geographical areas.

2 Each geographical area (or spatial unit) in the classification (such as the Adelaide Statistical Division) constitutes a particular 'category' of the classification, and all spatial units of a particular type which together cover a defined area, eg all Statistical Divisions in Australia, constitute a particular 'hierarchical level' of the classification.

3 Further, the ASGC has been constructed as an integrated multi-structured hierarchical classification. This means that it is a classification in which the spatial units (ie the categories) at the lower levels of the classification (eg Census Collection Districts or CD's) serve as building blocks which are aggregated upwards in several parallel streams (or chains) into larger and larger spatial units at progressively higher hierarchical levels of the classification. Each of these streams, consisting of two or more vertically related hierarchical levels (of which the CD level is always the lowest), represents a different ASGC structure. These different structures are said to be integrated because they are ultimately all constructed from the same set of spatial unit building blocks.

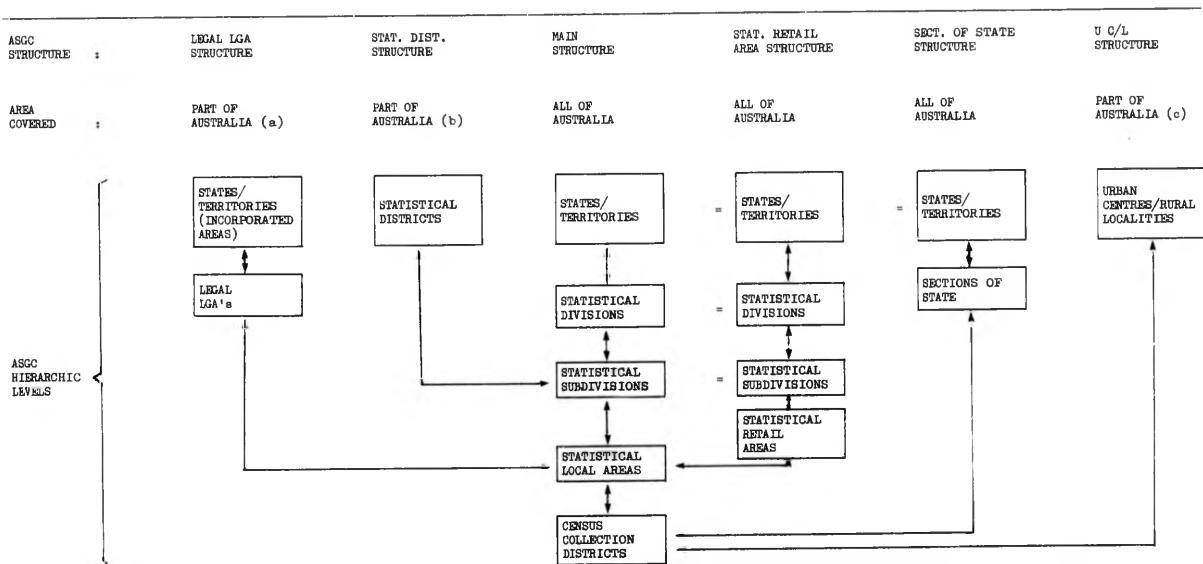

4 The diagram on page 8 depicts the ASGC in its entirety in terms of its various structures, the hierarchical levels in them and the relationships between them. Each of these structures is described in more detail in the following paragraphs.

Main Structure

5 The Main structure of the ASGC is depicted by the central hierarchy in the diagram on page 8. In this structure Census Collection Districts, the smallest spatial units in the ASGC, collectively cover all of Australia and add, without gaps or overlaps, to Statistical Local Areas (SLA's). Collectively, these cover the same geographical area and are either coextensive with or add, without gaps or overlaps, to Statistical Subdivisions. Similar relationships apply to the remainder of the hierarchy, ie between Statistical Subdivisions and Statistical Divisions and between Statistical Divisions and States/Territories.

6 However, Census Collection Districts are defined only for those times at which a Census of Population and Housing is held. Accordingly, the full Main structure can only exist at those times. At all other times the Main structure of the ASGC consists of the top four hierarchical levels, ie the Statistical Local Areas, Statistical Subdivisions, Statistical Divisions and States/Territories. This situation will in general be reflected in the ASGC manual which is expected to be updated continuously and which will present, for any given point in time, the Main structure relevant at that time. The current Main structure of the ASGC down to the Statistical Local Area level is set out, in detail, in Chapter 6 of this manual.

ASGC STRUCTURAL CHART

NOTES/SYMBOLS:

- (a) The 'incorporated' part of Australia.
- (b) The part of Australia covered by all Statistical Districts.
- (c) The part of Australia covered by all Urban Centres/(Rural) Localities.

'=' means equality between adjoining levels.

'-->' means that the spatial units in adjoining hierarchic levels are related to each other by aggregation or disaggregation.

Statistical District Structure

7 Statistical Districts are the more important, predominantly urban, areas of Australia other than the Capital City Statistical Divisions. Statistical Districts cannot be incorporated in the Main structure for two reasons:

(a) some (eg Gold Coast - Tweed) have boundaries that cut across State/Territory and hence, Statistical Division boundaries, thereby preventing them from being fitted into the Main structure; and

(b) the total area covered by them relates only to a part of Australia, whereas the total area covered by the Main structure categories relates to the whole of Australia.

8 Each Statistical District in the ASGC consists, as shown in the full Statistical District structure in Chapter 6, of either one particular Statistical Subdivision or two or more particular Statistical Subdivisions. Each of these Subdivisions consists of Statistical Local Areas which, in turn, consist of Census Collection Districts.

Accordingly, the Statistical District structure of the ASGC can be depicted as follows:

In this structure the Census Collection Districts and higher level spatial units are confined to those which fall within Statistical Districts and relate to each other by aggregation or disaggregation as shown above.

9 Although this structure consists conceptually of the four hierarchic levels depicted above, only the spatial units in the top three levels are normally used for the presentation of statistics according to the Statistical District structure. (Further, as already mentioned in the description of the Main structure above, the Census Collection Districts only form part of this structure at those times when a Census of Population and Housing is held). The current Statistical District structure of the ASGC down to the Statistical Local Area level is set out in detail, in Chapter 6 of this manual.

Legal Local Government Area Structure

10 Each Legal LGA (Local Government Area) represents the whole, undivided geographical area of responsibility of an incorporated Local Government Council. Legal LGA's cannot be included in the Main structure for two reasons:

- (a) some (eg Albert Shire in Queensland) have boundaries that cut across Statistical Subdivisions and Statistical Divisions thereby preventing them from being fitted into the Main structure; and
- (b) the total area covered by them relates only to a part of Australia, whereas the total area covered by the Main structure categories relates to the whole of Australia.

11 Each Legal LGA in the ASGC consists of either one particular Statistical Local Area or two or more particular Statistical Local Areas which, in turn, consist of Census Collection Districts. Legal LGA's can be aggregated to State/Territory totals although the areas represented by these totals only cover the 'incorporated' parts of the State/Territory concerned.

Accordingly, the Legal LGA structure of the ASGC can be depicted as follows:

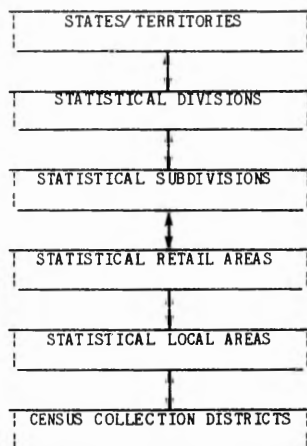

In this structure the Census Collection Districts and the Statistical Local Areas are confined to those which fall within Legal LGA's and relate to each other by aggregation and disaggregation.

12 Although this structure consists conceptually of the four hierarchic levels depicted above, only the spatial units in the top two or three levels would normally be used for the presentation of statistics according to the Legal LGA structure. (Further, as mentioned in the description of the Main structure above, the Census Collection Districts only form part of this structure in those years in which a Census of Population and Housing is held). The current Legal LGA structure of the ASGC down to the Statistical Local Area level is set out, in detail, in the Alphabetic List of Legal LGA's and Statistical Local Areas within States/Territories in Chapter 6 of this manual.

Statistical Retail Area Structure

13 Each Statistical Retail Area in the ASGC consists of either one particular Statistical Local Area or an aggregation of two or more particular contiguous Statistical Local Areas within a Statistical Subdivision.

14 The Statistical Retail Area structure can be depicted as follows:

In this structure the spatial units in adjoining levels are related to each other by aggregation and disaggregation (ie without gaps or overlaps) and, within each level, cover all of Australia.

15 The Statistical Retail Area (SRA) structure is in essence the Main structure with an additional hierarchic level for Statistical Retail Areas (see para 25 of Chapter 3). This structure is presented separately because it causes Statistical Local Areas within Statistical Subdivisions to be grouped differently from their grouping in the Main structure and because it is only valid at those times when a Census of Retail Establishments is held.

16 Although this structure consists conceptually of the six hierarchic levels depicted above, only the spatial units in the top five levels would normally be used for the presentation of Retail Census Statistics. (Further, as mentioned in the description of the Main structure, the Census Collection Districts only form part of this structure at those times when a Census of Population and Housing is held).

17 The Statistical Retail Area structure is not currently applicable and has therefore not been included in Chapter 6 of this manual. However, a draft of the next Statistical Retail Area structure, based on current Statistical Local Areas and subject to further review and amendment, is set out in Appendix 1 for illustrative purposes.

Urban Centre/(Rural) Locality Structure

18 Each urban centre or bounded rural locality consists of either one particular non-rural Census Collection District or an aggregation of two or more contiguous non-rural Census Collection Districts with the same Section of State code. Urban Centres/(Rural) Localities cannot be incorporated in the Main structure of the ASGC for the following reasons:

- (a) their boundaries are generally inconsistent with the boundaries of Statistical Local Areas and higher level Main structure spatial units; and
- (b) the total area covered by them relates only to a part of Australia, whereas the total area covered by the Main structure categories relates to the whole of Australia.

19 The Urban Centre/(Rural) Locality structure of the ASGC can be depicted as follows:

In this structure, Census Collection Districts are confined to those which fall within Urban Centres and (Rural) Localities and relate to them by aggregation and disaggregation.

20 This structure is only relevant at those times when a Census of Population and Housing is held and has therefore not been included in Chapter 6 of this manual. However, Appendix 2 lists, for general background information, the Urban Centres/(Rural) Localities identified at the time of the last, ie 1981 Census of Population and Housing.

Section of State Structure

21 Within each State/Territory each Section of State represents an aggregation of not always contiguous geographical areas of a particular urban type, with the rural balance constituting another Section of State. Collectively, they cover all of Australia. Sections of State cannot be incorporated in the Main structure of the ASGC because they do not conform to or align with any of the broader spatial unit types in the Main structure.

22 The Section of State structure of the ASGC can be depicted as follows:

In this structure Census Collection Districts, which collectively cover all of Australia, add without gaps or overlaps, to Sections of State which, in turn, add to States/Territories.

23 Because this structure is only relevant at those times when a Census of Population and Housing is held, it does not appear in this edition of the ASGC. However, the particular Sections of State in each State/Territory are described in Chapter 3 'The Spatial Units of the Classification'.

THE ASGC IN ABS STATISTICAL GEOGRAPHY

24 The ASGC is the principal Australia-wide geographical classification of the ABS for use in the compilation and provision of geographically classified statistics.

25 The statistics classified by the ABS according to the ASGC⁽¹⁾ are not all classified at the most detailed, ie the Census Collection District, level of the ASGC - that level is used, with some exceptions, solely for Population Census statistics.

26 Another important aspect of the ASGC is that it cannot, for technical and other reasons, incorporate all the spatial unit types according to which geographically classified statistics are required by users. Accordingly, the ABS uses, in addition to the ASGC, other geographical classifications and individual, ie 'stand alone', spatial units for the provision of statistics. These other classifications and stand alone spatial units are quite numerous and vary in use from 'regular' to 'ad hoc' depending on user demand. The spatial unit types covered by these other classifications divide into two broad classes as follows:

(a) ABS defined spatial unit types which have been devised for use in a particular State or Territory and which are relevant only to that State or Territory. An example is the set of New South Wales Statistical Agricultural Areas used in the ABS publication: Agricultural Sector: Land Use, Artificial Fertilisers and Other Improvements - New South Wales (Catalogue Number 7104.1). Such spatial unit types have been excluded from the ASGC, at present, because they are relevant only to a particular State or Territory and have not been formulated in accordance with standard Australia-wide spatial unit definitions as are ASGC spatial unit types.

Other, including most economic statistics, are classified, in general, at the Statistical Local Area level of the ASGC. This is largely being done for the reason that most economic statistics, including employment statistics, would generally be confidential at the very detailed Census Collection District level of the ASGC, particularly if also cross classified by industry and other characteristics. This means, of course, that, in general, only Population Census statistics can be produced for all ASGC structures for all of their hierarchic levels while most other statistics can, at best, only be provided according to the 'Main', 'Legal LGA', 'Statistical District' and 'Statistical Retail Area' structures of the ASGC down to the Statistical Local Area level of detail, confidentiality and other considerations permitting.

(1) In classifying statistics according to the ASGC it is not usually the individual items of data that are classified but the statistical units, eg the establishment/locations, households or persons to which the statistics relate that are classified. Data about the units are then aggregated and presented in statistical tables according to the classification categories relevant to the units involved.

(b) Non-ABS spatial unit types, other than Legal LGA's and States/Territories, which have been adopted for use by the ABS for the dissemination of statistics. These cannot, in general, be exactly aligned with any configuration of ASGC spatial units. This fact and/or their special purpose nature in many cases precludes them from incorporation in the ASGC. Examples of spatial unit types in this class are -

- . Postcode Areas
- . Commonwealth Electoral Divisions
- . State Electoral Divisions
- . Victorian Parishes and Counties
- . South Australian Hundreds and Counties
- . New South Wales Health Regions
- . Queensland Rainfall Stations and Regions
- . Australian Map Grid Squares in Western Australia.

27 The extent to which the spatial units in the ASGC can be linked and aggregated to equal or approximate spatial units in the other types of geographical classifications, mentioned in (a) and (b) above, varies considerably as illustrated by the following examples -

- . New South Wales Statistical Agricultural Areas are exact aggregations of ASGC Statistical Subdivisions and Statistical Divisions in New South Wales
- . Postcode Areas can be approximated by aggregations of ASGC Census Collection Districts but not by aggregations of broader ASGC spatial units
- . Victorian Parishes cannot be represented, with any acceptable degree of approximation, by aggregations of any ASGC spatial units.

28 The foregoing means that dual or multiple geographical coding (ie geocoding) of those statistical units must be undertaken by the ABS where the statistics are required to be produced not only according to the ASGC but also according to those other geographical classifications and stand alone spatial units which cannot be related to the ASGC, such as Victorian Parishes in the case of Victorian agricultural statistics.

29 The complete configuration of geographical classifications and stand alone spatial units used by the ABS, including the ASGC, and the relationships between the spatial units within this configuration will be described in a more comprehensive ABS document entitled the 'Geographical Classification Framework' (GCF). This document is currently under development and is expected to contain the following:

(a) a set of descriptive entries, one for each classification (including the ASGC) and each stand alone spatial unit. In the case of the smaller geographical classifications and the stand alone spatial units, the entry relevant to each would fully specify and describe the classification or spatial unit. In the case of the larger geographical classifications, which, like the ASGC, will be fully set out in separate manuals, the entry relevant to each would provide a summary description of the classification and refer the user to the detailed manual for further information;

- (b) diagrams with some explanatory text which illustrate the relationships that exist between the classifications and stand alone spatial units in the framework;
- (c) detailed keys which link relatable spatial units in different classifications with each other; and
- (d) a set of maps, where available, which portray the classifications.

30 At this early stage of GCF development there is still some uncertainty as to whether it would be preferable to incorporate Population Census Destination Zones and Work Study Areas as an additional classification in the GCF or as another structure within the ASGC. Theoretically, the latter treatment would appear to be appropriate and is likely to be implemented in future ASGC editions.

PURPOSES AND PRINCIPLES OF THE CLASSIFICATION

31 The main purposes of the ASGC are to enable spatially (ie geographically) classified statistics to be produced on a spatially useful and comparable basis and in a cost effective manner.

32 In order to serve these purposes a geographical classification such as the ASGC should satisfy a number of requirements or principles. These provide that:

(a) the categories (or spatial units) of the classification must be useful, ie represent geographical areas for which statistical information is required by users of statistics;

(b) the categories within each hierarchic level of the classification must be -

- . of a particular defined type
- . clearly delimited with precisely drawn boundaries
- . uniquely identified by codes and names
- . mutually exclusive and jointly exhaustive of the total area covered by the hierarchic level;

(c) all the hierarchic levels which constitute a particular classification structure must -

- . cover the same defined geographical area (eg 'Australia' in the case of all the hierarchic levels of the Main structure of the ASGC, or all the incorporated areas of Australia in the case of all the hierarchic levels of the Legal LGA structure of the ASGC)
- . form a chain of linked levels in which the categories in adjoining levels relate to each other by aggregation or disaggregation (ie in the sense that each broader level spatial unit must be coextensive with one or more lower level spatial units); and

(d) all the structures of an integrated multi-structured classification must link up at one or more of their levels, ie share a common set of categories at these levels.

33 The ASGC has been constructed in accordance with these principles as described below.

34 With regard to the first of these principles, ie usefulness, it is worth noting that the categories (or spatial units) now incorporated in the ASGC have been used by the ABS for many years prior to the construction of the ASGC. Their usefulness has been well established over those years and has also been reconfirmed in a user survey. This survey was conducted in 1982 and inquired into statistical user needs for spatial units according to which statistics are wanted.

35 Apart from confirming a strong user demand for the types of spatial unit now incorporated in the ASGC the other main findings of the survey indicated -

- . a demand for a facility that permits existing statistics to be produced for a great variety of different, customer specified, spatial units
- . a need for stability in spatial unit boundaries over time (especially in the case of Census Collection Districts and Statistical Local Areas)
- . a need to improve the delimitation of some particular spatial units, eg to make some of them more homogeneous in terms of land use or urban and rural characteristics.

36 The first two needs identified in the preceding paragraph cannot be met quickly and cheaply. The first suggests the development of a costly positional geocoding system which would permit statistics to be assembled automatically for any user defined area having a geographically referenced boundary. The second suggests the possible need to introduce a completely new type of spatial unit, such as the Australian Map Grid square, which will remain stable over time. (This latter suggestion arises because the existing ASGC spatial units, being tied to changing LGA boundaries and physical features, are inherently unstable over time.) Accordingly, further consideration has to be given to these issues before the ASGC or the broader GCF can be enhanced to meet the user needs identified above.

37 The need to improve the delimitation of particular ASGC spatial units has been accepted as a general aim and will be addressed in periodic and ad hoc reviews of ASGC spatial units which will be undertaken within the context of ongoing ASGC maintenance.

38 In view of the strong user demand for the present ASGC spatial units it is considered that they satisfy the first principle, ie that of usefulness, listed in paragraph 32(a) in spite of their relative lack of stability over time. The fact that the ASGC or GCF does not yet incorporate all the spatial units and facilities desired by users does not affect the validity of the present ASGC categories nor does it inhibit the incorporation of new spatial unit types to the ASGC or GCF if justified in terms of adequate user needs.

39 The other principles outlined in paragraph 32 are all concerned with the architecture and specification of the classification and have been rigorously observed in the construction of the ASGC. As a result the ASGC facilitates efficient coding, compilation and publication of geographically classified statistics on a spatially comparable basis.

CHAPTER 3 : THE SPATIAL UNITS OF THE CLASSIFICATION

1 The spatial unit types which have been incorporated in the ASGC and the criteria relevant to their delimitation are outlined in this chapter.

CENSUS COLLECTION DISTRICT (CD)

2 The CD is the smallest spatial unit type in the ASGC. It has been designed for use in the Census of Population and Housing as the basic collection, coding, processing, tabulation and publication unit. Its use in other statistics is limited, at present, to the compilation and release of building approval statistics in certain areas.

3 The basic concept of a CD is that of a ten day field workload area of a census collector which also serves as the smallest area building block in the ASGC for the aggregation of CD statistics for higher level ASGC spatial units.

4 In urban areas CD's average about 300 dwellings, while in rural areas the number of dwellings per CD reduces as population densities decrease. For the 1981 Census of Population and Housing 26,759 CD's were delimited throughout Australia.

5 The criteria according to which CD's are delimited are as follows:

- (a) the area and population delimited by a CD boundary must not be so great that one collector cannot deliver and collect census schedules within about ten days;
- (b) the size and shape of the CD must be consistent with its role as a spatial unit and building block capable of aggregation into broader level ASGC spatial units;
- (c) the chosen CD boundaries must be readily identifiable on the ground, be defined in terms of permanent features, follow the centre of a road or river if these features are used and should conform to existing and proposed land uses;
- (d) CD's must not cross SLA boundaries and, as a consequence, any other ASGC spatial unit boundary;
- (e) CD's should be as homogeneous as possible; and
- (f) CD's in aggregate must cover the whole of Australia without omission or duplication.

6 More detailed rules and procedures for delimiting CD's are contained in the ABS CD Boundary Design Manual.

STATISTICAL LOCAL AREA (SLA)

7 The SLA is a Legal LGA based or equivalent spatial unit which serves as the smallest spatial unit for the coding, compilation and publication of economic, social and demographic statistics (other than those collected in Population Censuses) and as a key intermediate level spatial unit for the compilation and publication of Population Census statistics.

8 SLA's must consist of one or more Census Collection Districts and must cover, in aggregate, the whole of Australia without gaps or overlaps. They are the largest area building blocks of which the Legal LGA's, Statistical Retail Areas and Statistical Subdivisions are composed.

9 Within that part of Australia which is covered by incorporated Local Government councils, SLA's are Legal LGA based spatial units, while in the remainder of Australia SLA's are Legal LGA equivalent spatial units.

10 The criteria according to which SLA's are delimited are as follows:

(a) A Legal LGA is adopted as an SLA if it meets the following criteria:

(i) fits wholly within a Statistical Subdivision and a Statistical Retail Area, and

(ii) is broadly similar in size, economic and statistical significance to equivalent Legal LGA's, elsewhere in Australia.

(b) A Legal LGA which does not satisfy the conditions in (a)(i) and/or (ii) above must, in general, be split into parts which do satisfy these conditions. Each such part must then be treated as an SLA. The circumstances in which Legal LGA's are split are:

(i) where the boundaries of one or more Statistical Subdivisions, or of a Statistical Retail Area, cut across a Legal LGA the Legal LGA must be split into two or more parts - each corresponding to that which falls within the relevant Statistical Subdivision or Statistical Retail Area, and

(ii) where, on a consensus of subjective assessments, a particular Legal LGA is substantially different from other equivalent Legal LGA's in terms of size and economic significance or in terms of user needs for statistics, the Legal LGA can be split into two or more parts - each corresponding to one or more suburbs in the case of predominantly urban LGA's. (The number of Legal LGA's split so far on this basis is very small and includes the City of Brisbane as the major example.)

(c) All unincorporated on-shore areas and off-shore islands within a Statistical Subdivision of an Australian State must be treated as one SLA unless a part of such an unincorporated area is considered economically significant. In these instances separate SLA's can be formed, eg for each unincorporated off-shore island (or designated group of unincorporated off-shore islands) which, on the basis of a consensus of subjective assessments, are considered to be economically significant - each such SLA is included in the State or Territory which has jurisdiction over it (eg, Lord Howe Island in NSW and the group of Bass Strait islands in Victoria).

(d) Oil rigs and other man-made platforms are formed into a set of seven 'off-shore' areas, one per State and the Northern Territory. Each State and Territory set of off-shore areas is then to be treated as a separate SLA of the relevant State or Territory.

(e) In the Northern Territory the unincorporated area within each Statistical Subdivision is either adopted as a single SLA (eg as in the case of Daly) or split into two or more legal LGA equivalent SLA's to separately distinguish an economically significant town (eg Nhulunbuy), island (eg Groote Eylandt) or administrative region. (It might be noted that all of the NT is unincorporated with the exception of the areas covered by the Legal LGAs of Darwin, Alice Springs, Tennant Creek and Katherine.)

(f) In the Australian Capital Territory, which is entirely unincorporated, each Statistical Subdivision is split into two or more Legal LGA equivalent SLA's to separately distinguish:

- (i) within the 'Canberra Statistical Division', each suburb, locality and predominantly non-urban ACT District (or balance thereof), and
- (ii) within the 'Balance of the Territory Statistical Division', each contiguous area.

STATISTICAL SUBDIVISION (SSD)

11 The SSD is the smaller of two statistical 'general purpose' regional type spatial units in the ASGC - the other is the Statistical Division.

12 SSD's must consist of one or more Statistical Local Areas (SLA's) and must cover, in aggregate, the whole of Australia without gaps or overlaps. They are the largest area building blocks of which the Statistical Divisions and Statistical Districts are composed.

13 The criteria according to which SSD's are delimited are basically the same as for Statistical Divisions. This means that:

(a) SSD's which are mainly non-urban, ie outside State capital city Statistical Divisions or outside Statistical Districts are, in general, delimited in accordance with the Statistical Division criteria in paragraphs 16 and 17 (b) below; and

(b) SSD's which are mainly urban, ie within State capital city Statistical Divisions or within Statistical Districts and represent dissections of these Divisions or Districts, are in general, delimited only in accordance with the more broadly stated Statistical Division criteria in paragraph 16 below.

In addition, the following conditions also apply:

- (i) each Statistical District that falls entirely within a State or Territory must consist of one or more whole SSD's,
- (ii) each Statistical District that straddles a State/Territory boundary must consist of one or more whole SSD's on either side of the boundary, and
- (iii) a Statistical Division which contains an SSD that is also a Statistical District (or part of a Statistical District) must at least have one other SSD constituting the remainder of the Statistical Division even though that second SSD may not have a predominant town or cluster of towns that wields a unifying social and economic influence over the region.

STATISTICAL DIVISION (SD)

14 The SD is the larger of two statistical 'general purpose' regional type spatial units in the ASGC - the smaller one is the Statistical Subdivision (SSD).

15 SD's must consist of one or more Statistical Subdivisions and must cover, in aggregate, the whole of Australia without gaps or overlaps. They must not cross State or Territory boundaries and are the largest statistical area building blocks of which the Australian States and internal Territories are composed.

16 The currently applicable basis for delimiting SD's was determined by the 31st and 33rd Conferences of Statisticians of Australia in 1969 and 1973. Resolution 2 of the 1973 Conference states:

- (a) that Statistical Divisions should ideally be delimited in all States on the basis of socio-economic criteria and should where possible embrace contiguous whole local government areas;
- (b) that the boundaries of the Statistical Divisions so delimited should be changed only at infrequent intervals, for example, at periods of 15 to 20 years; and
- (c) that, if practicable, such revisions in Statistical Division boundaries should be determined in time for use in the next Census of Population and Housing.

17 Elaborations of this general basis for delimiting SD's are supplied by the Resolutions of the 1969, ie 31st, Conference of Statisticians which are mainly concerned with delimiting urban centres, and the guidelines incorporated in the ABS 'CD Boundary Design Manual'.

These provide:

(a) that delimitation of State capital city SD's is to be based on Resolution 3 of the 1969 Conference as subsequently amended by general agreement in 1975. This amended Resolution, which also applies to Statistical Districts, states:

"That around each urban centre with a population of at least 25,000 a further boundary encompassing a Statistical District or Capital City Statistical Division (see Resolution 8(a) and 8(b)), shall be defined after consultation with planners, to contain the anticipated development of the urban centre and associated smaller urban centres for a period of at least twenty years. It shall consist of whole local government areas if possible. Where suitable municipal, city or town boundaries contain the urban centre they may be used as statistical district boundaries. This fixed boundary (as distinct from the urban boundary which is moving) will delimit an area which, for general statistical purposes, is free from the practical problems imposed by the moving boundary, but which nevertheless represents the city in a wider sense. This procedure shall not be applied to separate urban centres within Statistical Districts or within Capital City Statistical Divisions." And

(b) that in delimiting other SD's, subparagraph (a) of Resolution 2 of the 33rd, ie 1973, Conference of Statisticians (reproduced in paragraph 16 above) should be interpreted to mean that a SD should be a relatively homogeneous region characterised by identifiable social and economic links between the inhabitants and between the economic units within the region, under the unifying influence of one or more major towns or cities.

18 In accordance with the foregoing, Statistical Divisions have been delimited within individual States and Territories as follows:

(a) In NEW SOUTH WALES Proclaimed NSW Government Regions coincide with Statistical Divisions with one exception; the proclaimed NSW Government Region of NORTH COAST consists of the SD's of Richmond-Tweed and Mid-North Coast. The boundaries of these Regions have been delimited on the basis that the degree of economic and social intercourse within each Region should be maximised. Statistical and other data used in delimiting the boundaries have included available information about transport patterns, the intensity of trunk telephone calls to and from major cities and towns, the pattern of retail shopping and the marketing of fresh goods, circulation areas of some provincial newspapers and coverage of principal radio stations.

(b) In VICTORIA the Statistical Divisions correspond with the State Planning Regions adopted by the Victorian Government in October 1981 except in the Port Phillip Region and, because of consequential effects, the Central Highlands and Loddon-Campaspe Regions. The Victorian Government's Port Phillip Region is comprised of the Melbourne and East Central Statistical Divisions and the Shires of Bacchus Marsh and Gisborne which are in the Central Highlands and Loddon-Campaspe Statistical Divisions respectively.

The Planning Regions are the largest units of a three tier system consisting of Regions, Subregions and Local LGA's. Subregions, in all but exceptional cases, are aggregates of whole Local LGA's, and Regions are always aggregates of Subregions. The boundaries of these Regions and Subregions have been delimited by taking account of the following:

- (i) comparisons with other ways of dividing the State, including the previous Central Planning Authority regions, and various areas used for the presentation of statistics,
- (ii) natural physical systems, such as climatic, river, geological, topographic and geographic systems,
- (iii) regional communication systems, and
- (iv) various functional socio-economic factors such as patterns of travel, shopping and employment, newspaper circulation, regional zoning of sporting, social and community welfare organisations and library and hospital regions;

(c) in QUEENSLAND formal State Planning Regions have been abolished and SD's accord with the general considerations and criteria outlined in paragraphs 14 to 17 above. Nevertheless, they are also used on an informal basis for State Government planning purposes, where relevant;

(d) in SOUTH AUSTRALIA State Planning Regions, as proposed by the Committee on Uniform Regional Boundaries for Government Departments (CURB), were adopted by the South Australian Government in 1976. The South Australian SD's and SSD's are based on them. CURB Regions are based on two distinct, but complementary, sets of criteria. The first set is oriented towards defining the region as a structural entity on the basis of such factors as:

- . population distribution, density and change
- . production data
- . dominant occupations in industrial and rural sectors
- . socio-economic, ethnic and social factors, and
- . existing political boundaries (eg local government), etc.

while the second set of criteria is oriented towards defining the region as a functional entity on the basis of the following type of factors:

- . government department service areas
- . newspaper circulation
- . telephone traffic
- . retail trading patterns, and
- . traffic flows, etc.

As mentioned above, South Australian Statistical Divisions and Subdivisions are based on, but are not always congruent with, the CURB Regions. Even though the Statistical Divisions are not, in every case, identical with CURB Regions, in all cases they are directly convertible to these Regions. For instance, the Adelaide and Outer Adelaide Statistical Divisions comprise 4 CURB Regions, and statistical information for these 4 CURB Regions can be obtained by aggregating Statistical Subdivisions within the Adelaide and Outer Adelaide Statistical Divisions.

(e) In WESTERN AUSTRALIA State Planning Regions and Subregions, as proposed by the State Statistical Coordination Committee, were adopted by the Western Australian Government in January 1976. The Western Australian SD's and SSD's coincide with them. These Regions and Subregions have been devised in accordance with the following criteria:

(i) the Perth Metropolitan Region and the Subregions within it should be delimited in such a way that:

- . they are consistent with the overall concepts and planning details proposed in the Town Planning Department's 'Corridor Plan for Perth',
- . they must take cognizance of Local LGA's, and
- . they should be built up from smaller units such as CD's; and

(ii) delimitation of the rural regions and subregions should take cognizance of:

- . the concept of 'community of economic and social interest'
- . the character of natural resources
- . area dispersion of population and industry and the size of towns
- . road and railway systems, and
- . production and marketing practices, etc;

(f) In TASMANIA the SD's accord with the general considerations and criteria outlined in paragraphs 14 to 17 above and are also considered to be satisfactory for the purpose of State Government planning.

(g) In the NORTHERN TERRITORY SD's are based on Territory Government Administrative Regions, and are consistent with the general considerations and criteria for their delimitation as described in paragraphs 14 to 17 above.

(h) In the AUSTRALIAN CAPITAL TERRITORY SD's accord with the general considerations and criteria for their delimitation as described in paragraphs 14 to 17 above.

STATE/TERRITORY

19 The State/Territory is the largest type of spatial unit in the ASGC. There are six States and two Territories in Australia, viz New South Wales, Victoria, Queensland, South Australia, Western Australia, Tasmania, the Northern Territory and the Australian Capital Territory. They are political entities with fixed boundaries and the total area of each (including their off-shore islands) is used for statistical purposes as a separate spatial unit in the ASGC.

STATISTICAL DISTRICT (S DIST.)

20 In a broad sense Statistical Districts are the more important, predominantly urban (or potentially predominantly urban) areas of Australia outside State Capital City Statistical Divisions. There are, at present, 24 Statistical Districts in Australia and each is composed of one or more Statistical Subdivisions. Whilst the majority are contained wholly within one State/Territory, Statistical Districts can and in three instances, actually do cross State boundaries.

21 The criteria for delimiting Statistical Districts are the same as for Capital City Statistical Divisions, described in paragraph 17(a), but apply to population clusters (ie an urban centre, or two or more urban centres in close proximity) with a population of 25,000 or more. Like in the case of a State Capital City Statistical Division, the boundary of a Statistical District should contain the anticipated urban development of the centre for a period of at least twenty years and can cut across Legal LGA's which consist of urban and rural parts - see paragraph 29 below for urban centre criteria. Additionally, a Statistical District may also be delimited in the case of an urban centre with less than 25,000 population where the ABS determines that there is a demand for intercensal population estimates for the area and that existing Legal LGA or SLA boundaries are obviously inadequate for this purpose.

LEGAL LOCAL GOVERNMENT AREA (LGA)

22 The Legal Local Government Area is a type of spatial unit which represents the whole undivided geographical area of responsibility of an incorporated Local Government Council. There are over 830 Legal LGA's in Australia which collectively cover only a part of Australia. (The major areas not covered by Legal LGA's are the large northern parts of South Australia, almost all of the Northern Territory and all of the Australian Capital Territory.)

23 The number of Legal LGA's and their boundaries are unstable over time. Their creation and delimitation is the responsibility of the respective State Governments and is governed by the provision of State Local Government Acts.

24 The various types of Legal LGA's in each State are:

- NEW SOUTH WALES: Cities*, Municipalities and Shires
- VICTORIA: Cities, Towns, Boroughs and Shires
- QUEENSLAND: Cities, Towns and Shires
- SOUTH AUSTRALIA: Cities*, Municipalities and District Councils
- WESTERN AUSTRALIA: Cities, Towns and Shires
- TASMANIA: Cities* and Municipalities
- NORTHERN TERRITORY: Cities and Towns.

(NOTE: * Municipalities proclaimed as Cities)

STATISTICAL RETAIL AREA (SRA)

25 SRA's consist of one or more adjoining SLA's and have been designed for use in the Census of Retail Establishments as the smallest spatial units for the publication of commodity and industry class statistics. Each SRA is intended to contain, as a general rule, at least 200 retail stores although in special cases this number may be considerably reduced. The main additional considerations which are taken into account when grouping SLA's into SRA's are as follows:

- (a) the socio-economic characteristics of the population;
- (b) transportation links;
- (c) topographical features (eg rivers or forests which form natural barriers between two areas); and
- (d) size of shopping centres.

26 SRA's must consist of one or more SLA's and must, in aggregate, cover the whole of Australia without gaps or overlaps. They cannot cross Statistical Subdivision boundaries.

URBAN CENTRE/(RURAL) LOCALITY (UC/L)

27 Broadly an urban centre is a population cluster of 1,000 or more people or a known holiday resort of smaller population if it contains 250 or more dwellings of which at least 100 are occupied. A locality is a population cluster of between 200 to 999 people. People living in urban centres are classified as urban for statistical purposes while those in localities are classified as rural. Each urban centre and locality is bounded (ie a boundary for it is clearly defined) and composed of one or more Census Collection Districts (CD's).

28 The criteria for delimiting or bounding urban centres and localities are based on those developed in 1965 by Dr G.J.R. Linge of the Australian National University. The criteria as currently in force, ie as adopted and subsequently amended by the Conference of Statisticians of Australia in 1965 and 1969, are set out below.

29 Each URBAN CENTRE WITH A POPULATION OF 25,000 OR MORE is to consist of a cluster of contiguous urban Census Collection Districts (CD's) and other urban areas. CD's and other areas classified as urban include the following:

- (a) All contiguous CDs which have a population density of 200 or more persons per square kilometre shall be classified as urban. Consequently, State, Statistical Division, Legal LGA and other administrative boundaries shall be disregarded in determining whether a CD should be urban or rural.
- (b) A CD which is known to contain a high proportion of holiday homes shall be classified as urban if it satisfies the following criteria:

(i) it has 250 or more dwellings at least 100 of which are occupied at the time of Census, and

(ii) the dwelling density is 50 per sq km or greater.

(c) A CD consisting mainly of land used for factories, airports, small sports areas, cemeteries, hostels, institutions, prisons, military camps or certain research stations shall be classified as urban if contiguous with CD's which are themselves urban.

(d) Any CD which consists mainly of land used for large sporting areas, large parks, explosives handling and munitions areas, or holding yards associated with meatworks and abattoirs shall be classified as urban only if it is bordered on three sides by CD's which are themselves urban.

(e) Any area which is completely surrounded by CD's which are urban must itself be classified as urban.

(f) Where an urban area of 25,000 or more population is separated from another urban area by a gap in actual development of less than three kilometres (by the shortest rail or road distance), the gap shall be bridged by classifying a connecting CD as urban, and therefore treating the urban areas as one; if the gap is three or more kilometres (and whether or not it is comprised mainly of reserved land or a natural barrier) the urban areas shall remain separate.

(g) Any CD used as a "bridge" CD and therefore designated as urban in 1971, or thereafter, shall continue to be so included unless the population of the urban area of which it is part falls below 25,000, in which case this will cease to apply. However, if a CD was incorrectly included (for whatever reason) in a Linge area at one Census, then it should not be included at the next Census unless it now meets the criteria.

(h) Large peripheral CD's in growth areas can be fragmented; and so far as the availability of visible boundary features allows, the fragments so created shall be as near square-shaped as possible and of such a size that they will contain a collection workload when fully developed. For the purposes of quantitatively delimiting urban centres such fragments shall be regarded as CD's.

30 EACH URBAN CENTRE WITH A POPULATION OF BETWEEN 1,000 AND 24,999 is to be devised as follows:

(a) The urban centre shall be delimited subjectively (by the inspection of aerial photographs, by field inspection and/or by consideration of any other information that is available) - guidelines of this purpose are described in paragraph 32 below.

(b) All contiguous urban growth is to be included (which, in small urban areas, would not necessarily occur if the density criterion was applied), together with any close but non-contiguous development which could be clearly regarded as part of the urban area. However, cognizance shall be taken, where appropriate, of Resolution 4, of the 31st Conference of Statisticians (paraphrased in paragraph 29 above), particularly in urban areas which are approaching a population of 25,000.

(c) In selecting the boundaries for the splitting of Collection Districts, cognizance shall be taken, where appropriate, of the boundaries of land-use zones.

31 (RURAL) LOCALITIES are to be devised as follows:

(a) All population clusters of less than 1,000 population and whose population is expected to reach 200 by the next census are to be examined as regards the drawing of a boundary around the area encompassing the cluster.

(b) The following criteria must be satisfied before a boundary is drawn around a locality. It must:

- . contain at least 200 people but not more than 999 by the next Census;
- . have 40 occupied non-farm dwellings with a discernible urban street pattern;
- . have discernible nucleus of population.

(c) If there is some doubt that a locality will reach the minimum population of 200 people then a boundary should still be drawn around the locality.

(d) Where, in the case of defence camps, construction camps, etc it is anticipated that the cluster will not exist at two consecutive censuses, these camps should not be bounded.

(e) The localities shall be delimited subjectively, by the use of the latest available aerial photographs, by field inspection and/or by consideration of any other information that is available. Guidelines for this purpose are outlined in the following paragraph.

32 Guidelines for the drawing of subjectively determined urban centre and locality boundaries are set out below:

(a) Wide rather than narrow boundaries are to be used to ensure inclusion of urban or built up areas, ie it is preferable to include some rural rather than exclude some urban areas. However, this guideline should be interpreted in the light of those following below.

(b) Continuity of urban development is the main criterion, ie boundaries are not to be thrown very wide just to include some small non-contiguous area or urban development. (The Linge criterion of 3 kilometres may be of assistance in this respect in larger urban centres of say greater than 10,000-15,000 population.)

(c) Where the subjective boundaries decided upon are contained within a municipal boundary and the "remainder" so left is small and/or of small population, the municipal boundary is to be used.

(d) For previously bounded statistical cities, statistical towns or localities the boundaries are not to be changed lightly, ie comparability is to be maintained with the past unless there are significant exclusions (either due to faulty boundaries at the previous Census or subsequent development).

- (e) Cognizance is to be taken of "approved plans" with regard to urban land usage.
- (f) Topographic boundaries must be used wherever possible where consistent with the above guidelines. (In individual cases it may be necessary to consider whether it is advisable to relax the present practice of always taking the middle of a street or river as the boundary.)

SECTION OF STATE

33 Within a State or Territory each Section of State represents an aggregation of non-contiguous geographical areas of a particular urban type, with the rural balance constituting another Section of State. The Sections of State within each State and Territory are the following:

- (a) Major Urban: All urban centres with a population of 100,000 and over.
- (b) Other Urban: All urban centres with a population of 1,000 to 99,999.
- (c) Locality: All localities with a population of 200 to 999.
- (d) Rural Balance: The remainder of the State/Territory.

34 Urban centres which are bisected by a State or Territory boundary have each half included in the relevant State's or Territory's Section of State.

OFF-SHORE AREA AND 'MIGRATORY' CATEGORIES

35 Off-shore oil rigs, drilling platforms and the like are treated collectively within each State and the Northern Territory as an off-shore area which is for Population Census purposes, combined with the respective State/Territory 'migratory' categories as explained below.

36 The 'migratory' categories relate only to the Census of Population and Housing where it is not possible to code every person to an ASGC spatial unit below State or Territory level. The persons that cannot be so coded are those enumerated on board vessels in and between Australian ports, or on board long distance trains, buses or aircraft. Such persons are classified as migratory and attributed to a State or Territory.

37 To facilitate the recording of migratory populations in the Census, the ASGC provides within each State and the Northern Territory a migratory category at the CD level, even though such a category is not a spatial unit in the conventional sense. This migratory CD is then combined with the off-shore area CD's to form one Statistical Local Area, Statistical Subdivision and Statistical Division within each State and the Northern Territory.

CHAPTER 4 : THE SPATIAL UNIT CODE SYSTEM

1 This chapter describes the system of nominal geocodes⁽¹⁾ which identify represent ASGC spatial units.

2 The ASGC code system consists of several standard sets of numeric codes - one for each group of spatial units of a particular type, eg Australian States and Territories. The standard code sets are supplemented by a special purpose code set which is described in paragraphs 6-8 below.

STANDARD ASGC CODES

3 The codes in some standard sets can be used independently, eg the codes for Statistical Districts or State and Territories, while those in others need to be used in association with codes from other sets, eg SLA codes which need to be used together with State and Territory codes for unambiguous Australia wide identification of SLA's.

4 The reasons for adopting such a system of codes are partly historical (to minimise the costs of conversion of pre-ASGC codes to ASGC codes) and partly practical (to minimise spatial unit code sizes and to provide flexibility of choice in presenting spatial unit hierarchies for statistical output purposes).

5 A separate standard ASGC code set exists for each of the following:

(a) Census Collection Districts (CD's)

The Collection District is the smallest geographical area used in the collection of Census data and is the area enumerated by one Census Collector. These are identified by a unique six digit code within each State and Territory. The first two digits identify Census Divisions (these closely follow Federal electoral boundaries), the next two digits identify Census Subdivisions (ie Census Field Group Leader Workload Areas) and the last two digits identify CD's within a Census Subdivision and are allocated sequentially from 01 within each Subdivision. For complete Australia wide identification the six digit code needs to be used in conjunction with the one digit State/Territory code. CD's are the basic building blocks for aggregation to higher geographical levels (eg to Statistical Local Areas).

NOTE: Census Subdivisions and Census Divisions are geographic regions used in the Population Census field enumeration system and are not part of the ASGC and differ completely from ASGC Statistical Subdivisions and Divisions.

(1) Nominal geocodes, as distinct from positional geocodes, merely identify spatial units by one or more symbols, eg numeric or alphanumeric codes. Positional geocodes also identify their location on maps.

(b) Statistical Local Areas (SLA's)

These are identified by unique four digit numeric codes within a State/Territory. They have the following features:

(i) within each State/Territory SLA codes are in the range 0001-9990 (excluding those ending with 99). (Codes ending with 99 and those within the range 9991-9999 have been reserved for special purposes);

(ii) the arrangement of SLA codes within each State/Territory is in ascending numerical order for alphabetically listed Legal LGA's/SLA's. Gaps have been provided between the codes of adjoining SLA's to provide space for future expansion or change;

(iii) the fourth, ie last, digit of the SLA code is used as an indicator for the following characteristics:

- 0 indicates that the SLA equates with a Legal LGA,
- 1-8 indicates that the SLA is a part Legal LGA, and
- 9 indicates that the SLA represents either, an unincorporated area, an off-shore/migratory category or an undefined category.

For unique Australia wide identification each SLA needs to be identified, at least, by its own four digit code plus the code of the relevant State/Territory.

NOTE: Due to limitations imposed by the computer processing environment to be used for producing output from the 1986 Census of Population and Housing, de facto Legal LGA codes must be allocated for 'Unincorporated' SLA's. In all these cases the relevant SLA code is to be used as the de facto Legal LGA code.

(c) Statistical Subdivisions (SSD's)

These are identified by unique two digit numeric codes within Statistical Divisions. Gaps between codes of adjoining SSD's provide space for future expansion or change. The ordering of SSD's within Statistical Divisions follows traditional practice. For unique Australia wide identification each SSD needs to be identified, at least, by its own two digit code plus the code of the relevant Statistical Division and State/Territory.

(d) Statistical Divisions (SD's)

These are identified by unique two digit numeric codes within States/Territories. Gaps between codes of adjoining SD's provide space for future expansion or change. The ordering of SD's within States/Territories follows traditional practice. For unique Australia wide identification each SD need to be identified, at least, by its own two digit code plus the code of the relevant State/Territory.

(e) States/Territories (S/T's)

These are identified by unique one digit numeric codes within Australia.

(f) Urban Centres/(Rural) Localities (UC/L's)

These are identified by unique five digit numeric codes within States/Territories. The arrangement of UC/L codes within each State/Territory is in ascending numerical order for alphabetically listed UC/L's. Gaps have been provided between the codes of adjoining UC/L's to provide space for future expansion or change. For unique Australia wide identification each UC/L needs to be identified, at least, by its own five digit code plus the code of the relevant State/Territory.

(g) Statistical Districts (S DIST's)

These are identified by unique four digit numeric codes within Australia. The first two digits indicate the State, Territory or States within which the Statistical District falls. The majority of the Statistical Districts are contained wholly within one State/Territory and this is indicated by a zero (0) as the second digit, with the first digit indicating the State or Territory. In cases where Statistical Districts cross States/Territories boundaries the first digit indicates the major State/Territory and the second digit the minor State/Territory. The last two digits have been allocated in ascending numerical order to traditionally arranged Statistical Districts. Gaps in codes between adjoining Statistical Districts provide for future expansion or change.

(h) Legal Local Government Areas (LGA's)

These are identified by unique four digit numeric codes within States/Territories. The Legal LGA codes were determined in conjunction with SLA codes and are strongly integrated with them. They have the following features:

- (i) they are identical with SLA codes in all cases where there is a strict one to one correspondence between Legal LGA's and SLA's;
- (ii) their first three digits are identical with the first three digits of SLA codes in all those cases where Legal LGA's consist of two, three, four or five SLA's.

The above described incorporation of the Legal LGA code in the SLA code permits almost all SLA's to be linked with their respective Legal LGA's. The only exceptions occur in Queensland and the Northern Territory in the case of the following Legal LGA's:

- . QLD : Albert, Brisbane, Logan, Pine Rivers and Redland;
- . NT : Darwin.

In these six exceptional cases the number of component SLA's of each of the Legal LGA's is too large for their codes to incorporate the links.

For unique Australia wide identification each Legal LGA needs to be identified, at least, by its own four digit code plus the code of the relevant State/Territory.

(i) Section of State

These are identified by unique one digit numeric codes within States/Territories and need, for Australia wide identification, to be associated with the code of the relevant State/Territory.

(j) Statistical Retail Areas (SRA's)

These are identified by unique four digit numeric codes within Australia. The first digit of the code specifies the State/Territory of the SRA and the remaining three digits identify the particular SRA within its State/Territory. The code is in ascending numerical order for SRA's listed in the following order: State/Territory x Statistical Division x Statistical Subdivision and alphabetically within Statistical Subdivision. Gaps in the code between SRA's in adjoining Statistical Subdivisions provide for future expansion or change.

SPECIAL PURPOSE ASGC CODES

6 For certain statistical operations it is necessary to make provisions for the geographical classification of statistical information in cases where only incomplete information is available on the location of this information. For example, a particular Population Census Schedule might provide insufficient location information to enable other information collected on the Schedule to be coded to an SLA or even a Statistical Subdivision. This usually occurs as a result of questions relating to usual residence 1 year ago and 5 years ago. There are many instances in such cases where only the Capital City or State name is given. To enable such vaguely specified information to be coded within the main structure of the ASGC a system of special undefined spatial categories and codes has been devised for input processing purposes.

7 In this system the two digit code of 88 (in the case of SSD's and SD's) and unique four digit SLA codes within States/Territories ending in 99 designate the undefined categories which are intended for the following uses:

(a) information required to be coded at SLA level but only codable at SSD level should be coded to the undefined SLA within the defined SSD;

(b) information required to be coded at the SLA level but only codable at SD level should be coded to the undefined SLA of the undefined SSD within the defined SD;

(c) information required to be coded at the SLA level but only codable at the State/Territory level should be coded to the undefined SLA (9899) of the undefined SSD in the undefined SD within the defined State/Territory;

(d) information required to be coded at the SLA level but only codable at the Australian level should be coded to the undefined SLA (9099) of the undefined SSD in the undefined SD of the undefined State in Australia. (The undefined State is designated by the code 9. This is particularly true in cases where usual residence information is not stated); and

(e) a further SLA code of 9199 is to be used in 'usual residence' and similarly worded coding where the information is not applicable (eg children who were not alive 5 years ago).

8 For example, the undefined spatial unit codes within the Statistical Division of Sydney are as follows:

<u>ASGC CODE</u>				<u>ASGC SPATIAL UNIT NAME</u>
S	SD	SSD	SLA	
1				NEW SOUTH WALES
	05			SYDNEY
		05		CENTRAL SYDNEY
			0199	CENTRAL SYDNEY UNDEFINED
		10		INNER WESTERN SYDNEY
			0399	INNER WESTERN SYDNEY UNDEFINED
		15		SOUTHERN SYDNEY
			0599	SOUTHERN SYDNEY UNDEFINED
		20		SOUTH WESTERN SYDNEY
			0799	SOUTH WESTERN SYDNEY UNDEFINED
		25		WESTERN SYDNEY
			0999	WESTERN SYDNEY UNDEFINED
		30		NORTHERN SYDNEY
			1199	NORTHERN SYDNEY UNDEFINED
		35		GOSFORD-WYONG
			1399	GOSFORD-WYONG UNDEFINED
		88		SYDNEY UNDEFINED

NOTE: (i) The first two digits of the undefined SLA Code are normally in the range 00 to 89 (usually with a gap of 1) in main ASGC structure order with the last two digits always being 99; and

(ii) The undefined SLA code for each Capital City is 0099.

In addition the undefined Statistical Division for each State is:

S	SD	SSD	SLA	
1	88	88	9899	NSW UNDEFINED
2	88	88	9899	VIC UNDEFINED
3	88	88	9899	QLD UNDEFINED
4	88	88	9899	SA UNDEFINED
5	88	88	9899	WA UNDEFINED
6	88	88	9899	TAS UNDEFINED
7	88	88	9899	NT UNDEFINED
8	88	88	9899	ACT UNDEFINED

while the undefined State would be designated by State/Territory code 9 as follows:

9	88	88	9099	STATE UNDEFINED (ie Australia) or for Population Census purposes NOT STATED
9	88	88	9199	NOT APPLICABLE

CHAPTER 5 : MAINTENANCE OF THE CLASSIFICATION AND ITS USE IN PUBLICATION

MAINTENANCE OF THE ASGC MANUAL

- 1 The ASGC manual is being kept up to date on a continuous rather than on a periodic basis by the issue of replacement pages.
- 2 The spatial unit and other changes for which the ASGC manual is being updated are essentially of two kinds:
 - a Externally imposed changes. These relate to administrative or political areas which have been adopted as spatial units in the ASGC. The ABS has usually no influence or control over changes to such spatial units which have to be made to the ASGC manual virtually as they occur. The most usual changes of this type are changes to Legal LGA's which are determined by the local and State Governments involved. These changes can range from Legal LGA boundary variations to the creation or amalgamation of whole Legal LGA's and do usually require consequential changes to related ASGC spatial units such as SLA's.
 - b All other changes. These cover changes to statistical type spatial units, such as Census Collection Districts and Statistical Districts, to the principles and criteria which govern their delimitation, and to all the explanatory and other material in the ASGC manual. Although changes of this type are, on occasions, triggered by changes to administrative or political areas, described in (a) above, they usually involve a flow from ad hoc or systematic reviews and tend to be implemented in the ASGC manual in time for particular statistical collections such as the Census of Population and Housing or the Census of Retail Establishments.

MAINTENANCE OF ASGC BASED/RELATED MATERIAL

- 3 The ASGC manual presents the classification primarily in a conceptual sense and as a statistical standard according to which spatially (ie geographically) classified statistics are to be produced. For purposes of applying the ASGC in statistical work, however, additional and more specialised ASGC based or related material is needed which has to be maintained by relevant ABS organisational entities in accordance with the ASGC manual. Some of the more important types of this material are briefly described below.

ASGC Descriptor Sets

- 4 ASGC descriptor sets are complete, partial or modified reproductions of ASGC structures (such as the 'Main structure' of the ASGC in Chapter 6 of this manual) which are used primarily as stubs in statistical tabulations and tables. They are nowadays usually held on computer files from which they can be accessed automatically for table generation. Any ASGC descriptor sets, which are modified reproductions of complete or partial ASGC structures, would still conform in all essential respects with the standard ASGC structures from which they are derived but might incorporate permitted combinations of adjoining ASGC categories and provide additional entries for showing statistical totals. Such modifications can be quite numerous and descriptor sets incorporating them tend to be increasingly produced from standard descriptor sets by the use of special computer programs in accordance with the needs of particular tables in different statistical series rather than by specifying and storing each such set separately.

5 The main body of standard ASGC descriptor sets is held on ABS Data Dictionary (DD) computer files from which each set is accessible to authorised users of the DD or in print form through the information services of the ABS. Current descriptor sets for ASGC structures can be identified on the DD by their classification name or descriptor set names as listed below.

<u>DD CLASSIFICATION NAME</u>	<u>DESCRIPTOR SET NAMES</u>
ASGC-DETAILED-MAIN-STRUCTURE	CGC-STATES-OF-AUSTRALIA-JULY84 CGC-STAT-DIVISIONS-JULY84 GCC-STAT-SUBDIVISIONS-JULY84 CGC-STAT-LOCAL-AREAS-JULY84
ASGC-STAT-DISTRICT-STRUCTURE	CGC-STAT-DISTRICTS-JULY84 CGC-STAT-DIST-SUBDIV-JULY84 CGC-STAT-DIST-SLAS-JULY84
ALPHA-LIST-OF-LGA-SLA-BY-STATE	CGC-ALPHA-ORDER-AUST-JULY84 CGC-LOCAL-GOVT-AREAS-JULY84 CGC-ALPHA-LIST-BY-STATE-JULY84

6 A 'time stamping' facility on the ABS Data Dictionary further enhances descriptor set maintenance by recording for each individual ASGC spatial unit the period during which it is operative in terms of a starting and finishing date. This facility enables ASGC descriptor sets and full ASGC structures to be identified and/or produced for any given date and ASGC spatial unit changes over any specified period, eg between two different operative versions of the ASGC, to be identified and listed. For example, any publication containing statistics classified in accordance with a particular version of the ASGC could specify that particular version in terms of its operative date and list the spatial unit changes which have taken place between that version of the ASGC and any other.

7 Current ASGC spatial unit records on the DD carry, as the starting date of their operative period, the ASGC introduction date, ie 5th July 1984 (840705) and 31st December 1999 (991231) as the ending date of their operative period. When changes to ASGC spatial unit records are made, the superceded record will have the ending date brought forward to the day before the new record takes effect, namely: the date of acceptance or the agreed date of implementation.

Area Coding Reference Data

8 Area coding reference data consist essentially of localities and streets/localities tables or indexes which specify for each locality and, where necessary, for street addresses within localities the appropriate spatial unit code or codes. Additionally, the term can also cover various keys and conversion tables which specify for one set of spatial unit codes (eg SLA codes) the codes of related spatial units (eg of Statistical Districts) to facilitate data conversion in cases where only one spatial unit code has been assigned to the data.

9 The localities and streets/localities tables and indexes are needed for the purpose of determining and assigning spatial unit codes for statistical units and are nowadays held mainly on computer media for accessing in automatic coding operations or for producing manuscripts for printing of hard copy indexes used in manual coding processes.

Maps

10 Maps depicting spatial unit boundaries and other features are needed generally for the following purposes:

- (a) precise delimitation of spatial units, eg for precise specification of area coding reference data or for use by field staff in collecting statistical information;
- (b) collection and geographic encoding of Census of Population and Housing data. The maps used for this purpose are referred to as Census Field Maps and depict Census Collection Districts which are updated for each Census; and
- (c) presentation of statistical information. For this purpose a wide variety of maps are produced and published which either accompany statistical tables or incorporate, as map features, statistical information as in the Atlas of Population and Housing.

Geographic Base Files and Similar Data Stores and Systems

11 There are computer files and systems which incorporate spatial unit information for use in automated statistical processing. The largest of these is the Geographic Base File which has been developed for the 1986 Census of Population and Housing. It incorporates most of the ASGC spatial unit specifications (such as their codes, hierarchic links and, in the case of the CD's, their digitised boundary points) as well as those of other spatial units for which Census output is to be produced such as electoral districts.

CO-ORDINATION OF ASGC MAINTENANCE

12 Maintenance of the ASGC manual and of ASGC based/related material is shared by a number of organisational entities within ABS State and Central Offices and is co-ordinated by Classification Section which also has responsibility for maintaining the ASGC manual and the ASGC descriptor sets on the ABS Data Dictionary.

13 Examples of major ASGC and related maintenance functions, handled outside Classification Section or shared with it, include the following:

(a) delimitation of CD's, urban centres and other Population Census specific spatial units in accordance with ASGC criteria and the specification of Population Census maps - these tasks are carried out in ABS State and Central Offices and are the responsibility of Population Census and Demography Branch;

(b) maintenance of area coding reference data on the ABS Integrated Register - this task is carried out in ABS State and Central Offices and is the responsibility of the Register Administration and Services Section; and

(c) conduct of spatial unit reviews and preparation of proposals to vary existing statistical type spatial units and/or spatial unit criteria - these tasks are undertaken, in most cases, by ABS State Office organisational units concerned with the provision of geographically classified statistics. Under existing co-ordination arrangements the results of all such work would flow to Classification Section for assessment (in conjunction with other ASGC users) and co-ordinated implementation.

USE OF THE ASGC IN PUBLICATION OF STATISTICS

14 The ASGC has been constructed to, inter alia, enable spatially classified statistics to be produced on a spatially comparable basis. However, actual production and publication of spatially comparable statistics also requires that the ASGC be consistently applied in statistical work.

15 Accordingly it is recommended that in publishing statistics according to the ASGC:

- (a) each table should relate to one particular ASGC structure only, which should ideally be presented in full and be identified in the table heading or a table footnote;
- (b) ASGC codes and spatial unit names should both be shown in table stubs or column headings and should conform with those in the ASGC or authorised ASGC descriptor sets;
- (c) omission of one or more hierarchic levels in a particular ASGC structure is permitted (eg omission of the entire CD level and/or the entire SSD level within the main structure of the ASGC) provided the omissions are noted somewhere in the publication and, preferably explained; and
- (d) ASGC spatial units can be combined (eg where statistics for one or more of them are confidential) provided the combinations are confined to spatial units which are:
 - . within one ASGC structure
 - . at one hierarchic level, and
 - . within the spatial unit at the next hierarchic level to which they are directly related,

eg: to two or more SLA's within an SSD or to two or more SSD's within an SD in the main structure of the ASGC.

16 There may, of course, be circumstances where it is not possible to conform with these recommendations. In these cases application of the recommendations may be relaxed with Classification Section agreement.

CHAPTER 6 : THE CLASSIFICATION

1 This chapter presents the current ASGC structures in their full detail. Those not current at present are shown in the Appendixes which also provide conversion keys linking existing area codes with ASGC codes.

2 The current ASGC structures presented in this chapter are the following:

. MAIN STRUCTURE OF THE ASGC. This is presented in two versions: one depicts the BROAD MAIN STRUCTURE (ie the Main structure down to Statistical Subdivision level) while the other depicts the full DETAILED MAIN STRUCTURE down to the Statistical Local Area level. (CD's are not current at this point in time and have therefore been excluded.)

. STATISTICAL DISTRICT STRUCTURE.

. LEGAL LGA STRUCTURE. This is presented in alphabetical order and is referred to as the ALPHABETIC LIST OF LEGAL LGA'S AND STATISTICAL LOCAL AREAS WITHIN STATES/ TERRITORIES.

3 The number of ASGC spatial units in these structures is, at present, as follows:

<u>SPATIAL UNIT</u>	<u>NSW</u>	<u>VIC</u>	<u>QLD</u>	<u>SA</u>	<u>WA</u>	<u>TAS</u>	<u>NT</u>	<u>ACT</u>	<u>AUST</u>
States/Territories	1	1	1	1	1	1	1	1	8
Stat. Divisions	13	13	12	8	10	5	3	2	66
Stat. Subdivisions	39	19	21	23	26	9	12	7	156
Stat. Local Areas	187	237	365	148	147	68	47	98	1297
Legal LGA's	175	211	135	125	139	49	4	-	838
Stat. Districts (a)	7	5	8	1	-	2	-	1	24

(a) Counted in predominant State/Territory.
